THE SCIENCE OF COLOURS:
COSMIC AND HUMAN COLOUR RAYS
By | Dr. Joseph B. Majdalani (J.B.M.)

Very few have written about the science of colors, the role colors play in one's self-knowledge, their influence on personality, inquiring into their relationship and effect on daily life, or investigating their role in self-evolution. This book unveils the significance of colours in the human psyche, their symbols, their relation to the cosmic rays and life vibrations, all of which are reflected in the aura, that electro-magnetic field surrounding man's physical body. How do colour rays interact in this field? How do they affect and are in turn affected by man's behavior? Colours are the language of the esoteric side in man and its nutrition, alike the food as nourishment for the body.
